Smart Crop Disease Detection & Medicine Recommendation

Upload Crop Image

Crop Name

Tomato

Symptoms

Large water-soaked brown patches have developed on the leaves. White fuzzy mold is visible on the underside of infected leaves during humid weather. The fruits have firm dark brown lesions, and the plant is wilting rapidly.

Diagnose Disease

AI Diagnosis Report

Crop

Tomato plants are one of the most popular garden crops, but they can be susceptible to various diseases. The symptoms described, such as large water-soaked brown patches on the leaves, white fuzzy mold on the underside of infected leaves, and firm dark brown lesions on the fruits, indicate a serious fungal infection.

Disease

The predicted disease is Septoria Leaf Spot, a common and destructive fungal disease caused by the fungus *Septoria lycopersici*. This disease is characterized by the development of black or brown spots on the lower leaves of tomato plants, and can lead to defoliation and reduced fruit production if left untreated.

Cause

The cause of Septoria Leaf Spot is excessive moisture and high humidity, which create an ideal environment for the fungus to grow

and spread. The disease can be spread through infected plant debris, weeds, and contaminated water.

Top 3 Medicines

The following are the top 3 medicines for treating Septoria Leaf Spot:

- **Quadris:** A fungicide that provides effective control of Septoria Leaf Spot and other fungal diseases.
- **Daconil:** A fungicide that offers three-way protection against Septoria Leaf Spot and other fungal diseases, and can be used as a targeted treatment for individual plants or small garden areas.
- **Flint:** A fungicide that is labeled for control of Septoria Leaf Spot and other fungal diseases, and can be used as part of an integrated pest management strategy.

Organic Remedy

Organic fungicides such as copper or baking soda solutions can be used to treat Septoria Leaf Spot. Products like Novobac's FloraEgis are also available as a natural alternative to chemical fungicides.

Prevention Tips

To prevent Septoria Leaf Spot, follow these tips:

- Remove infected plant debris and weeds from the garden site
- Use a soaker hose to keep the foliage dry
- Control weeds, especially nightshade and horsenettle, which can host the fungus
- Maintain good sanitation and hygiene practices in the garden
- Avoid overhead watering, which can splash water onto the leaves and create an ideal environment for the fungus to grow
